

Saudi Retail Business Intelligence Dashboard Report

Power BI reporting for retail sales performance, customer behavior, inventory risk, profitability, and branch operations in Saudi Arabia.

Prepared by	Yasir Awad - Data Analyst
Project type	Freelance retail BI / Power BI dashboard
Domain	Retail Sales Customer analytics Inventory operations
Tools	Power BI DAX Power Query Data modeling
Purpose	Document dashboard objectives, verified findings, and recommendations

965.79K	12K	375.35K	38.86%
Total revenue	Total orders	Total profit	Profit margin

Confidentiality note: Client and store identities are anonymized. Product names are generic where necessary.

1. Executive Summary

This report documents a four-page Power BI solution designed to give retail managers one reliable view of sales, profitability, customer value, inventory exposure, and branch performance.

Business problem

Operational and commercial metrics were distributed across sales, customer, product, branch, and inventory records. Management needed a clear way to identify revenue drivers, compare branch performance, monitor customer retention, and prioritize stock replenishment.

Project objectives

- Provide an executive view of revenue, orders, profit, and margin.
- Explain product, category, and branch contribution.
- Measure new and returning customer behavior.
- Identify products and branches exposed to stockout risk.
- Turn findings into practical management recommendations.

Dashboard structure

Page	Decision supported
Executive Overview	High-level KPI monitoring and revenue mix
Sales Performance	Product, category, branch, margin, and growth analysis
Customer Behavior	Customer value, retention, and segment analysis
Inventory & Operations	Stock coverage, reorder signals, and branch exposure

2. Business Questions and Method

Questions addressed

Area	Question
Sales	Which products, categories, and branches generate the strongest results?
Customers	How much value comes from returning customers and priority segments?
Inventory	Which fast-moving products are at or below their reorder threshold?
Management	Where should replenishment and retention actions be prioritized?

Implementation approach

- Structured sales, customer, product, branch, calendar, and inventory tables.
- Used dedicated DAX measure tables for each reporting page.
- Applied consistent filters and reusable dimensions across report visuals.
- Validated dashboard statements against displayed totals before documentation.
- Used a linear scale for branch comparisons to avoid visual distortion.

Validation decisions

The unsupported claim that the top three products generated more than 30% of revenue was removed. The verified top-five contribution is 249.89K, or approximately 25.9%. The comparison card is labeled Prior Period Revenue because its 870.01K value is a report-context baseline rather than a standalone monthly total.

3. Dashboard Page - Executive Overview

Executive view of revenue, orders, profit, margin, monthly movement, category contribution, leading products, and branch performance.

Key findings

- Revenue reached 965.79K, with 375.35K profit and a 38.86% margin.
- Vape generated 418.55K, representing 43.34% of revenue.
- Tabuk led branch revenue at approximately 252.82K.
- November and December produced the strongest monthly results.

Business interpretation

The overview gives management one concise performance checkpoint while preserving drill-down paths into product, customer, and inventory decisions.

4. Dashboard Page - Sales Performance Analysis

Product contribution, branch comparison, category margins, prior-period revenue, and growth analysis.

Key findings

- The top five products generated 249.89K, or approximately 25.9% of revenue.
- The current-context revenue is 11% above the 870.01K prior-period baseline.
- Vape delivered the strongest category margin at 43.5%.
- Branch revenue was relatively balanced, with Tabuk narrowly leading.

Business interpretation

Management can protect availability for high-contribution products while using category margins and branch demand together for commercial planning.

5. Dashboard Page - Customer Behavior Analysis

Customer count, revenue per customer, ordering frequency, retention contribution, and value segmentation.

Key findings

- The report tracks 500 customers and approximately 1.93K revenue per customer.
- Returning customers contributed 501.23K, or 51.9% of revenue.
- The base includes 261 new customers and 239 returning customers.
- Only 11 customers are classified as high value, indicating retention opportunity.

Business interpretation

Retention campaigns should focus on medium- and high-value customers while tracking returning-customer revenue as a primary loyalty KPI.

6. Dashboard Page - Inventory & Operations Analysis

Stock level, average stock, reorder exposure, fast-moving products at risk, and low-stock products by branch.

Key findings

- Total stock is approximately 18K, with an average of 110 units per product.
- Seventeen products reached the reorder threshold.
- Jeddah has the highest exposure, with seven low-stock products.
- Inventory coverage remains 89.38%, but fast-moving items still require action.

Business interpretation

Demand and stock exposure should be reviewed together so replenishment protects future sales rather than responding only after a stockout occurs.

7. Recommendations and Project Outcome

Business recommendations

- Review the 17 reorder-required products every week.
- Prioritize high-revenue, fast-moving products during replenishment.
- Investigate Jeddah allocation and replenishment lead times.
- Protect availability in the Vape category while monitoring concentration risk.
- Target medium- and high-value customers with retention campaigns.
- Use branch demand and inventory exposure together for stock allocation.
- Prepare inventory earlier for the stronger November and December demand.

Project outcome

The project delivers a reusable management reporting layer that connects sales performance, profitability, customer behavior, and inventory risk. It demonstrates practical capability in Power BI, DAX, Power Query, data modeling, KPI design, validation, and business communication.

Files included

File	Purpose
Saudi_Retail_BI_Dashboard.pbix	Interactive four-page Power BI report
Saudi_Retail_BI_Dashboard_Report.pdf	Management-facing project report
README.md	Portfolio summary, findings, and review instructions
docs/	Data model and verified KPI documentation
tools/	Repeatable layout repair and report generation scripts
